

Project – 3: Customer 360 Data Integration

Overview:

A retail business wants to build a unified Customer 360 view by integrating data from multiple sources, including online transactions, in-store purchases, customer service interactions, and loyalty programs. This project uses a mix of fact and dimension tables to ensure a clean, scalable structure.

Dataset used: <https://www.kaggle.com/datasets/varunkumari/customer-360-data>

Tools used:

- Azure Synapse Analytics
- Azure Data Lake Gen2 Storage
- Azure SQL Database
- Azure Keyvault
- Power BI
- Microsoft Fabric

Bronze Layer:

In this layer, we are simply uploading all the files of the dataset from the local system into a folder called bronze layer into the adlsgen2 storage account container.

The screenshot shows the Microsoft Azure portal interface for a storage account named 'adlsgen2s'. Under the 'Containers' section, a container named 'project-3' is selected. The 'Overview' tab is active, displaying a table of files stored in the container. The table has columns for Name, Modified, Access tier, Archive status, Blob type, Size, and Lease state. All files are in the 'Hot (Inferred)' access tier and are available.

Name	Modified	Access tier	Archive status	Blob type	Size	Lease state
[...]						...
Agents.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	3.82 KB	Available
Customers.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	8.72 KB	Available
CustomerServiceInteractions.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	5 KB	Available
InStoreTransactions.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	4.62 KB	Available
LoyaltyAccounts.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	2.93 KB	Available
LoyaltyTransactions.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	3.67 KB	Available
OnlineTransactions.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	5.43 KB	Available
Products.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	2.57 KB	Available
Stores.csv	29/04/2025, 18:54:11	Hot (Inferred)		Block blob	4.84 KB	Available

Silver Layer:

In this layer, we'll be cleaning the data (remove null and duplicate values) using dataflows by fetching data from the bronze layer folder in adlsgen2 storage account and eventually storing it in our azure sql database.

First, let's create the tables in which we'll store our data in the sql database. The queries for the tables were already provided to us as follows:

```
CREATE TABLE Customers (  
    CustomerID INT PRIMARY KEY,  
    Name VARCHAR(100),  
    Email VARCHAR(100),  
    Address VARCHAR(255)  
);  
  
CREATE TABLE Products (  
    ProductID INT PRIMARY KEY,  
    Name VARCHAR(100),  
    Category VARCHAR(50),  
    Price DECIMAL(10, 2)  
);  
  
CREATE TABLE OnlineTransactions (  
    OrderID INT PRIMARY KEY,  
    CustomerID INT,  
    ProductID INT,  
    DateTime DATETIME,  
    PaymentMethod VARCHAR(50),  
    Amount DECIMAL(10, 2),  
    Status VARCHAR(20),  
    FOREIGN KEY (CustomerID) REFERENCES Customers(CustomerID),  
    FOREIGN KEY (ProductID) REFERENCES Products(ProductID)  
);  
  
CREATE TABLE Stores (  
    StoreID INT PRIMARY KEY,  
    Location VARCHAR(100),  
    Manager VARCHAR(100),  
    OpenHours VARCHAR(50)  
);
```

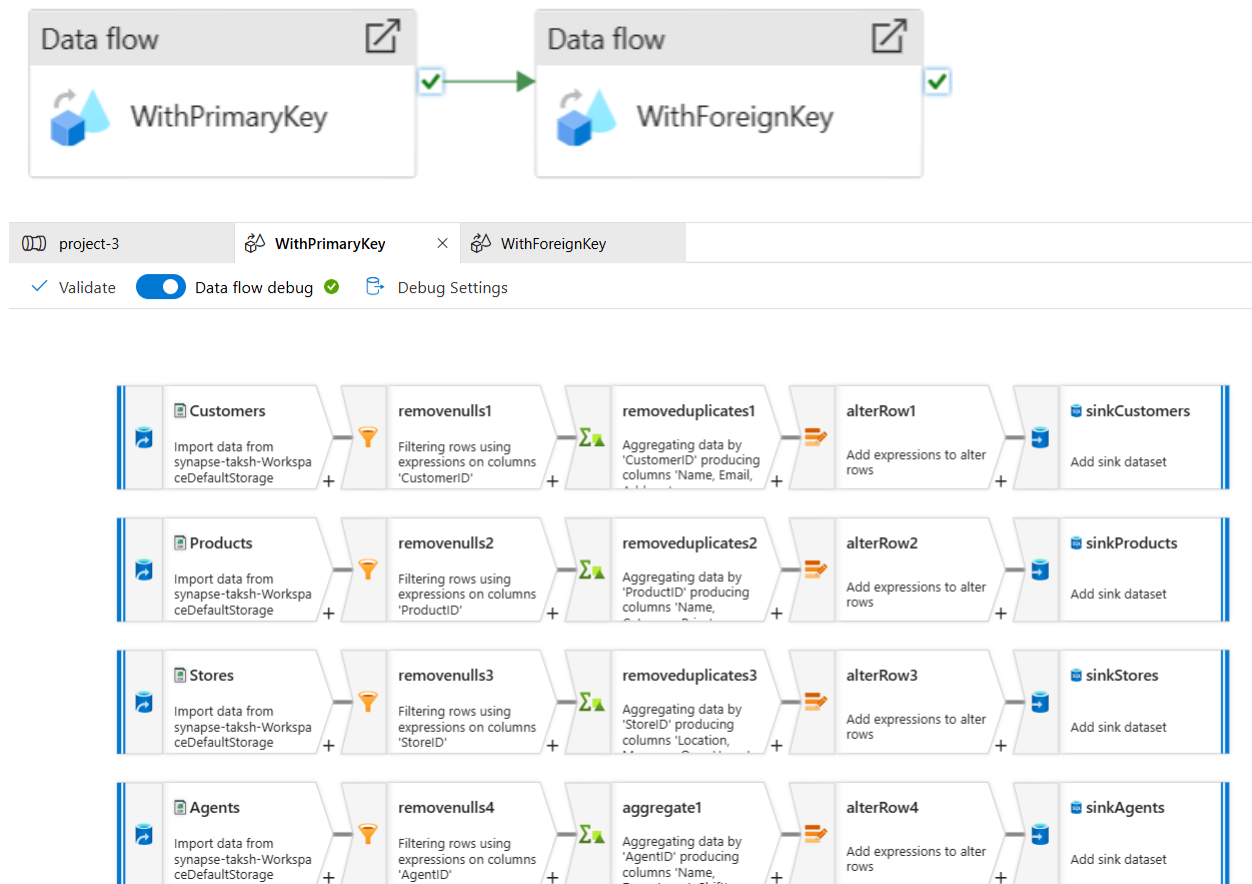

```
CREATE TABLE InStoreTransactions (  
    TransactionID INT PRIMARY KEY,  
    CustomerID INT,  
    StoreID INT,  
    DateTime DATETIME,  
    Amount DECIMAL(10, 2),  
    PaymentMethod VARCHAR(50),  
    FOREIGN KEY (CustomerID) REFERENCES Customers(CustomerID),  
    FOREIGN KEY (StoreID) REFERENCES Stores(StoreID)  
);  
  
CREATE TABLE Agents (  
    AgentID INT PRIMARY KEY,  
    Name VARCHAR(100),  
    Department VARCHAR(50),  
    Shift VARCHAR(50)  
);  
  
CREATE TABLE CustomerServiceInteractions (  
    InteractionID INT PRIMARY KEY,  
    CustomerID INT,  
    DateTime DATETIME,  
    AgentID INT,  
    IssueType VARCHAR(50),  
    ResolutionStatus VARCHAR(50),  
    FOREIGN KEY (CustomerID) REFERENCES Customers(CustomerID),  
    FOREIGN KEY (AgentID) REFERENCES Agents(AgentID)  
);  
  
CREATE TABLE LoyaltyAccounts (  
    LoyaltyID INT PRIMARY KEY,  
    CustomerID INT,  
    PointsEarned INT,  
    TierLevel VARCHAR(20),  
    JoinDate DATE,  
    FOREIGN KEY (CustomerID) REFERENCES Customers(CustomerID)  
);
```

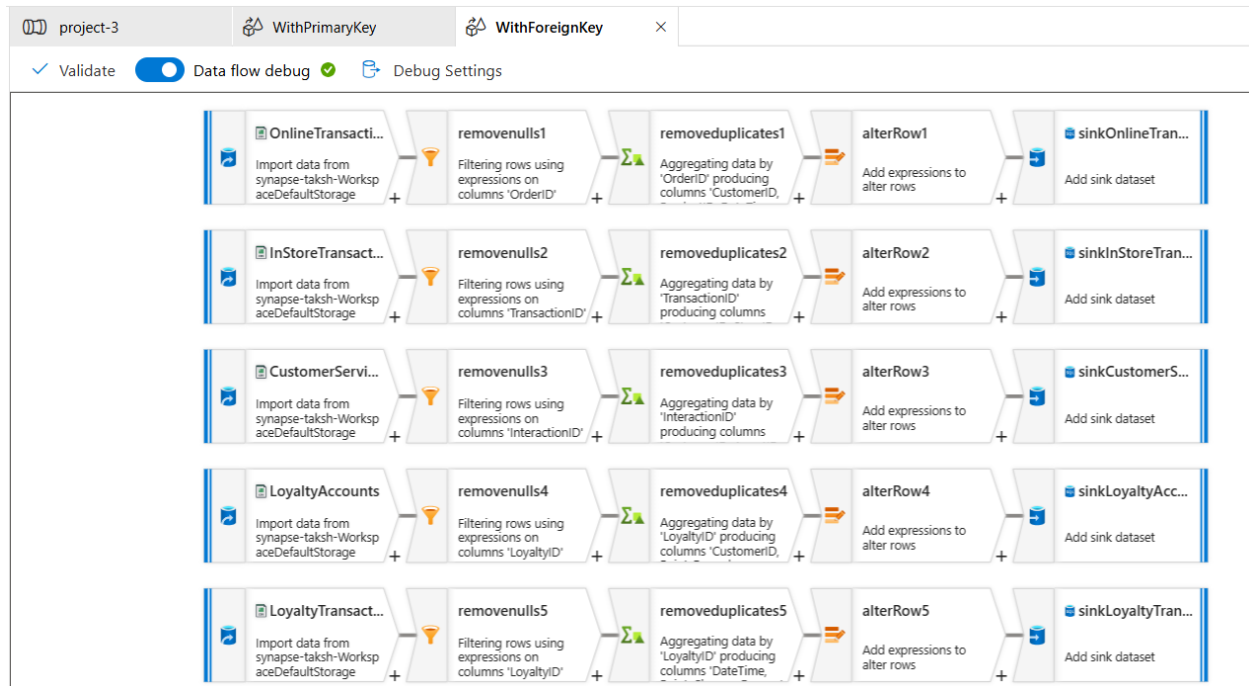

```
CREATE TABLE LoyaltyTransactions (
  LoyaltyID INT,
  DateTime DATETIME,
  PointsChange INT,
  Reason VARCHAR(100),
  PRIMARY KEY (LoyaltyID, DateTime),
  FOREIGN KEY (LoyaltyID) REFERENCES LoyaltyAccounts(LoyaltyID)
);
```

We'll create the tables in the same order as given here as there are dependencies between some of them.

We'll create 2 dataflows – one for all tables that have primary key and one for all the tables that have foreign keys in their schema and connect both the dataflows.

The data flow transformations for all source csv files will be the same so we'll discuss 1 of them below for our understanding.

Let's discuss the 1st table of withprimarykey dataflow, ie, customers table.

Source settings | Source options | Projection | Optimize | Inspect | Data preview ●

Output stream name * [Learn more](#)

Description [Reset](#)

Source type *

☐ Integration dataset
 ☒ **Inline**
☐ Workspace DB

Inline dataset type *

Linked service * [Test connection](#) [Edit](#) [New](#)

Skip line count

Sampling * ☐ Enable ☒ **Disable**

First, we configure the source by setting source type as inline and dataset type as delimited text as it's a csv file. Additionally, we'll select the linked service for connecting adlsgen2 storage account and synapse workspace.

Escape character

First row as header ☒

Null value

Under source options, we'll provide the path where our source csv file is located (adlsgen2 bronze layer folder) and make sure to select first row as header option.

Next, we connect the source with a filter transformation to remove null values from the source file.

Filter settings Optimize Inspect Data preview

Output stream name * [Learn more](#)

Here, “aggregates” section must have at least 1 column as that’s a mandatory requirement for the aggregate transformation. What we’ll do is provide the key column for “group by” section, meaning we want to group the data in the source file based on the key column, so in our case, since CustomerID is the key column, this means that we’ll group (or check) the data for each customer. Subsequently, we’ll provide all the other columns in the “aggregates” section. This essentially means that we’ll group the data to check some aggregates. In the expression field under “aggregates” section, we utilize the first() function which returns the first non-null value in a column.

Next, we connect it to an alter row transformation, where we basically provide permission to the dataflow to access and make changes to our sink, which will be azure sql database. We provide “upsert if 1==1” condition.

Finally, we connect it to a sink and configure it to point to our azure sql database as per the images provided below:

Gold Layer:

We are required to create some views on the data in sql and consequently generate reports on the data in Power BI as per the following requirements:

- **View 1** - for **Average Order Value (AOV)**
 - SUM(Amount) / COUNT(OrderByID) per product, category, and location.
- **View 2** - for Segment customers based on total spend, purchase frequency, and loyalty tier (**LoyaltyAccounts.TierLevel**).
 - Example: "High-Value Customers" (Top 10% spenders), "One-Time Buyers," "Loyalty Champions."
- **View 3** - for Analyze **DateTime** to find peak days and times in-store vs. online.
- **View 4** - for Number of interactions and resolution success rates per agent (**ResolutionStatus**).

Let's use SQL Server Management Studio (SSMS) to create and execute these queries.

View-1:

```
CREATE VIEW AverageOrderValue AS
SELECT
    P.ProductID,
    P.Name AS ProductName,
    P.Category,
    S.StoreID,
    S.Location,
    SUM(OT.Amount)/COUNT(OT.OrderByID) AS AverageOrderValue
FROM
    OnlineTransactions OT
JOIN
    Products P ON OT.ProductID = P.ProductID
JOIN
    Customers C ON OT.CustomerID = C.CustomerID
JOIN
    InStoreTransactions IST ON C.CustomerID = IST.CustomerID
JOIN
    Stores S ON IST.StoreID = S.StoreID
GROUP BY
    P.ProductID, P.Name, P.Category, S.StoreID, S.Location;
```

Output-1:

```
-- View the results
SELECT * FROM AverageOrderValue;
```

109 %
